Complementary Silicon High-Power Transistors

Designed for general-purpose power amplifier and switching applications.

- 25 A Collector Current
- Low Leakage Current -

 $I_{CEO} = 1.0 \text{ mA} @ 30 \text{ and } 60 \text{ V}$

• Excellent DC Gain -

 $h_{FE} = 40 \text{ Typ } @ 15 \text{ A}$

• High Current Gain Bandwidth Product -

 $|h_{fe}| = 3.0 \text{ min } @ I_{C}$ = 1.0 A, f = 1.0 MHz

• These are Pb-Free Devices*

MAXIMUM RATINGS

Rating	Symbol	TIP35A TIP36A	TIP35B TIP36B	TIP35C TIP36C	Unit
Collector - Emitter Voltage	V _{CEO}	60	80	100	Vdc
Collector - Base Voltage	V _{CB}	60	80	100	Vdc
Emitter - Base Voltage	V _{EB}		5.0		Vdc
Collector Current - Continuous - Peak (Note 1)	Ic	25 40		Adc	
Base Current - Continuous	Ι _Β		5.0		Adc
Total Power Dissipation @ T _C = 25°C Derate above 25°C	P _D		125		W W/°C
Operating and Storage Junction Temperature Range	T _J , T _{stg}	-65 to +150		°C	
Unclamped Inductive Load	E _{SB}		90	_	mJ

THERMAL CHARACTERISTICS

Characteristic	Symbol	Max	Unit
Thermal Resistance, Junction-to-Case	$R_{\theta JC}$	1.0	°C/W
Junction-To-Free-Air Thermal Resistance	$R_{\theta JA}$	35.7	°C/W

Stresses exceeding Maximum Ratings may damage the device. Maximum Ratings are stress ratings only. Functional operation above the Recommended Operating Conditions is not implied. Extended exposure to stresses above the Recommended Operating Conditions may affect device reliability.

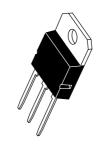

1. Pulse Test: Pulse Width = 10 ms, Duty Cycle \leq 10%.

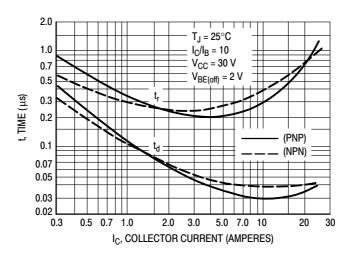

Figure 3. Turn-On Time

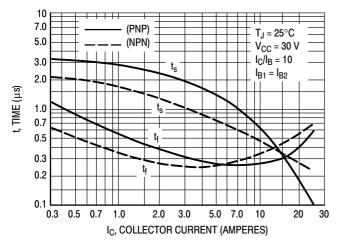

Figure 4. Turn-Off Time

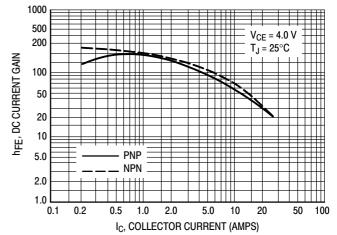

Figure 5. DC Current Gain

FORWARD BIAS

There are two limitations on the power handling ability of a transistor: average junction temperature and second breakdown. Safe operating area curves indicate $I_C - V_{CE}$ limits of the transistor that must be observed for reliable operation; i.e., the transistor must not be subjected to greater dissipation than the curves indicate.

The data of Figure 6 is based on $T_C = 25^{\circ}C$; $T_{J(pk)}$ is variable depending on power level. Second breakdown pulse limits are valid for duty cycles to 10% but must be derated when $T_C \ge 25^{\circ}C$. Second breakdown limitations do not derate the same as thermal limitations.

REVERSE BIAS

For inductive loads, high voltage and high current must be sustained simultaneously during turn-off, in most cases, with the base to emitter junction reverse biased. Under these conditions the collector voltage must be held to a safe level at or below a specific value of collector current. This can be accomplished by several means such as active clamping, RC snubbing, load line shaping, etc. The safe level for these devices is specified as Reverse Bias Safe Operating Area and represents the voltage-current conditions during reverse biased turn-off. This rating is verified under clamped conditions so that the device is never subjected to an avalanche mode. Figure 7 gives RBSOA characteristics.
